BOUNTY

AUTOMATE COLLEGE COURSE COLLECTION

Turn a university's name or website into public course and section data in a central database. DueGooder is a student planner: help students pick their school and section to get their schedule automatically. Design for hundreds or thousands of schools.

↳ WHAT TO BUILD

- Automatically find public catalogs and term schedules. Identify platforms such as Banner, PeopleSoft, Workday, or custom systems from URLs, pages, and public APIs.
- Reuse connectors across schools with minimal setup. Try a fallback for unfamiliar sources or flag them for manual review.
- Normalize school, term, department, course, section, instructor, meeting days and times, location, and enrollment status. Include source URLs and retrieval timestamps. Leave unavailable fields empty; distinguish missing data from extraction failures.
- Refresh without duplicates. Discover new terms; detect broken integrations, changed endpoints, and stale data. Collect actual sections and meeting times, not just descriptions.

↳ WHAT TO SUBMIT

Demo multiple universities with a connector shared across schools. Include code, run instructions, sample normalized data, and an explanation of setup, failure handling, and scaling.

Report an actual run: schools processed, data collected, runtime, cost, manual intervention, and failures. Explain cost calculations; label estimates. Discovery and collection should run automatically once started. Disclose human steps.

↳ HOW WE JUDGE

The best overall system wins. We judge section and meeting data accuracy; connector reuse and per-school setup and maintenance; cost and runtime at scale; and reliable updates and failure handling.

No fixed school quota or platform count. Breadth, completeness, and accuracy matter. Back scale and cost claims with measured results. You do not need every platform working during the hackathon.

↳ REWARD

\$500

to the winning team
